## Geodan and Esri Netherlands support Pakistan with Eagle

**Since last week, Eagle Crisis Management has delivered a contribution to the relief efforts in response to the flood disaster in Pakistan. Eagle is a location (geography) based Crisis Management System that helps coordinating disaster response.**

The system is used to create and store data fast and easily, in order to share the data with predefined user groups. Based on this information, relief efforts are coordinated and priorities are set to assign available resources. Eagle Crisis Management is also used to run analyses like the calculation of numbers of affected people and damage control/reduction. Eagle BV has decided to donate all necessary Eagle software to the largest province of Pakistan, Punjab. Last week, the software has been implemented and the first training programs have been executed by Eagle locally in Lahore, capital of the Punjab province.

Through the Microsoft network, Eagle came in touch with the disaster relief agency of the Punjab province in Pakistan. Shortly thereafter, four Eagle specialists took off. Two days after their arrival, most software components were installed (Microsoft SharePoint and Groove, Esri ArcGIS Server and Desktop and the Eagle Crisis Management Suite), local geodata was loaded in Eagle and the training programs were ready to be rolled out. Now, already 20 local staff members have been trained.

For the first time ever, Eagle Live has been placed in 'the cloud' (on the Internet). Eagle Live is a viewer that provides an easy-to-use situational overview through a web browser. To support the team in Pakistan, a support team in The Netherlands has simultaneously prepared an installation of Eagle Live. This made it possible to load situational information and to make this information publicly available from the moment the Eagle System was operational in Pakistan. This way of working makes it possible to publicize information that is needed for relief efforts very fast after a disaster occurs.
